

## Mounting a "pod-holder" on an Advance Lightness 2

I made a "Pod-holder" from a 25 cm. PVC pipe (5 cm. across) which I heated and flattened on the end. I drilled some holes on appropriate places (to fix the podholder on my Harness with tiewrap's) and made a "cut-out" for the button on my pod... I grinded all the edges round and sanded them smooth...

The pod with mi Xi Sphere 360 camera sat a bit loose in the podholder, so I wrapped a bit of velcro tape around the handle to make it fit better and make it stay firm in the holder.

When I launch I have my camera safe in the left pocket of my harness, and normally also secured with a rope to my harness ;-). And once in the air I place the pod in the podholder and extend it...

And this is how it looks with the pole extended...
